

FUNCTIONING

THE UNIDIRECTIONAL ROTATABLE BEZEL

The Oyster Perpetual Sea-Dweller DEEPSEA allows a diver to safely track his dive time thanks to the unidirectional graduated bezel featured on the watch.

At the beginning of a dive

Once in the water, before beginning his descent, the diver turns the bezel to align the triangle on the graduated bezel to the minute hand, thus indicating the start time of his dive.

During the dive

The dive time can be read against the graduated bezel.

Since the DEEPSEA bezel turns only counterclockwise, any accidental rotation can only have the effect of shortening the dive time.

THE GLIDELOCK CLASP

The new GLIDELOCK clasp allows for fine adjustments to the bracelet length, up to 18 mm by increments of 1.8 mm, without removing the watch.

- 1 Pull up the clasp's safety catch.
- 2 Pull up the centre panel of the clasp cover. The teeth located underneath it become visible.
- 3 Pull gently on the 12-o'clock side of the bracelet to lengthen it, or slide it into the clasp to shorten it. Adjustments can be made in 1.8 mm increments, up to a total of 18 mm.
- 4 Once the bracelet has been adjusted to the desired length, close the centre panel.
- 5 Close the safety catch.
